

CLAIMS

1. A space keeper for vertebrae or intervertebral disks comprising:
a tubular section having a longitudinal axis;
a base plate connected with an end of the tubular section; and
a top plate connected with the base plate wherein the top plate is
tiltable about an angle to the longitudinal axis of the tubular section.
2. The space keeper of claim 1 further comprising an elastic member
located between the top plate and the base plate.
3. The space keeper of claim 2 wherein the tubular section defines a
plurality of openings.
4. The space keeper of claim 3 wherein the openings of the tubular
section are lozenge-shaped.
5. The space keeper of claim 2 wherein the top plate has teeth that
engage a wall of a vertebral body end plate.
6. The space keeper of claim 1, wherein the base plate defines a
convex contact face and a first annular recess; the top plate defines a concave
recess and a second annular recess wherein the concave recess is congruent with
the convex contact face; and the space keeper further comprises a ring that is
located between the first annular recess and second annular recess wherein the ring
contacts the first annular recess and second annular recess.
7. The space keeper of claim 1 wherein the base plate defines a
concave contact face and a first annular recess; the top plate defines a concave
recess and a second annular recess; and the space keeper further comprises:
a biconvex shaped core positioned between the base plate and the
top plate, the core defining a top convex face and a base convex face that engage

the concave contact face and concave recess, respectively, the core also defining a top annular recess and a base annular recess; and

a first ring located between the first annular recess and base annular recess and a second ring located between the top annular recess and second annular recess.

8. The space keeper of claim 1 wherein the base plate defines a concave contact face; the top plate defines a concave recess; and the space keeper further comprises:

a core comprised of a top plan-convex lenticular body defining a top convex face, a base plan-convex lenticular body defining a base convex face, and a plan-parallel plate between the top plan-convex lenticular body and base plan-convex lenticular body, the core defining a bore, said top convex face engaging the concave recess and said base convex face engaging the concave contact face; and

a connecting sleeve located within the bore wherein the connecting sleeve connects the top plate with the base plate.

9. The space keeper of claim 1 wherein the base plate defines a concave contact face; the top plate defines a concave recess; and the space keeper further comprises:

a core comprised of a top plan-convex lenticular body defining a top convex face and a first annular recess, a base plan-convex lenticular body defining a base convex face and a second annular recess, said top convex face engaging the concave recess and said base convex face engaging the concave contact face, the core also defining a bore;

a connecting sleeve located within the bore wherein the connecting sleeve connects the top plate with the base plate; and

a ring located between the first annular recess and second annular recess.

10. The space keeper of claim 1 wherein the base plate defines a flat face; the top plate defines a concave recess; and the space keeper further comprises:

a core comprised of a plan-convex lenticular body defining a top convex face and a plan-parallel plate, said top convex face engaging the concave recess and said plan parallel plate being located between the flat face and the plan-convex lenticular body, the core also defining a bore; and

a connecting sleeve located within the bore wherein the connecting sleeve connects the top plate with the base plate.

11. The space keeper of claim 1 wherein the base plate defines a flat face having a first annular recess; the top plate defines a concave recess; and the space keeper further comprises:

a core comprised of a plan-convex lenticular body defining a top convex face and a second annular recess, said top convex face engaging the concave recess, the core also defining a bore;

a connecting sleeve located within the bore wherein the connecting sleeve connects the top plate with the base plate; and

a ring located between the first annular recess and second annular recess.

12. A space keeper for vertebrae or intervertebral disks comprising:

a tubular section having a longitudinal axis and having a first end and a second end;

a first element proximate to the first end of the tubular section wherein the first element has a base plate connected with the first end of the tubular section, a top plate connected with the base plate and an elastic member located between the top plate and the base plate; and

a second element proximate to the second end of the tubular section wherein the second element has a base plate connected with the second end of the

tubular section, a top plate connected with the base plate and an elastic member located between the top plate and the base plate;

wherein the top plates are tiltable about an angle to the longitudinal axis of the tubular section.

13. The space keeper of claim 12 wherein the tubular section defines a plurality of openings.

14. The space keeper of claim 13 wherein the openings of the tubular section are lozenge-shaped.

15. The space keeper of claim 12 wherein each top plate has teeth that engage a wall of a vertebral body end plate.
